Rocket Specification Sheet

Fill in the following information and turn in to your instructor prior to launch.

Rocket Name:
Team Members:
Predicted Maximum Altitude: (ft) / (m)
Mass: Initial Mass of Rocket:(g) (note: This is the total mass of everything that will be mounted on the launch pad. Structure, payload, motor, everything)
Payload Mass:(g) (note: Payload does not include altimeters, parachutes, etc. Payload is only the added mass that you put on beyond the provided h/w. See instructor if you have questions)

Cost:

Calculate the total cost based on the provided cost sheet.

Item	Cost per unit, unit length,	Quantity (#, length, or	Total Cost (\$)
	or unit area	area as appropriate)	
Motor			
Combination			
Cost			
Balsa Wood	\$100/in ²		
Body tube	\$1 K/in		
-			
Engine	\$5 K/unit		
Adapter			
System			

Total Cost of Rocket = \$_____

Cost to Payload Mass Ration (CMR)

Compute your CMR. CMR = (total cost of rocket in $/payload mass) / 10^7$.

CMR =_____
